How to derive DE?

How to derive DE?

- Take some derivatives of given master integrals in masses or/and kinematic invariants

How to derive DE?

- Take some derivatives of given master integrals in masses or/and kinematic invariants
- Express them in terms of Feynman integrals of the given family

How to derive DE?

- Take some derivatives of given master integrals in masses or/and kinematic invariants
- Express them in terms of Feynman integrals of the given family
(One can use LiteRed by Lee.)

How to derive DE?

- Take some derivatives of given master integrals in masses or/and kinematic invariants
- Express them in terms of Feynman integrals of the given family
(One can use LiteRed by Lee.)
- Apply an IBP reduction to express these integrals in terms of master integrals to obtain a system of differential equations

How to derive DE?

- Take some derivatives of given master integrals in masses or/and kinematic invariants
- Express them in terms of Feynman integrals of the given family
(One can use LiteRed by Lee.)
- Apply an IBP reduction to express these integrals in terms of master integrals to obtain a system of differential equations

After this: solve DE.

Let $f = (f_1, \dots, f_N)$ be *primary* master integrals (MI) for a given family of dimensionally regularized (with $D = 4 - 2\epsilon$) Feynman integrals.

Let $f = (f_1, \dots, f_N)$ be *primary* master integrals (MI) for a given family of dimensionally regularized (with $D = 4 - 2\epsilon$) Feynman integrals.

Let $x = (x_1, \dots, x_n)$ be kinematical variables and/or masses, or some new variables introduced to 'get rid of square roots'.

Let $f = (f_1, \dots, f_N)$ be *primary* master integrals (MI) for a given family of dimensionally regularized (with $D = 4 - 2\epsilon$) Feynman integrals.

Let $x = (x_1, \dots, x_n)$ be kinematical variables and/or masses, or some new variables introduced to 'get rid of square roots'.

DE:

$$\partial_i f(\epsilon, x) = A_i(\epsilon, x) f(\epsilon, x),$$

where $\partial_i = \frac{\partial}{\partial x_i}$, and each A_i is an $N \times N$ matrix.

Henn (2013): turn to a new basis where DE take the form

$$\partial_i f(\epsilon, x) = \epsilon A_i(x) f(\epsilon, x).$$

Henn (2013): turn to a new basis where DE take the form

$$\partial_i f(\epsilon, x) = \epsilon A_i(x) f(\epsilon, x).$$

In the differential form,

$$d f(\epsilon, x) = \epsilon (d \tilde{A}(x)) f(x, \epsilon),$$

where

$$\tilde{A} = \sum_k \tilde{A}_k \log(\alpha_k).$$

Henn (2013): turn to a new basis where DE take the form

$$\partial_i f(\epsilon, x) = \epsilon A_i(x) f(\epsilon, x).$$

In the differential form,

$$d f(\epsilon, x) = \epsilon (d \tilde{A}(x)) f(x, \epsilon),$$

where

$$\tilde{A} = \sum_k \tilde{A}_k \log(\alpha_k).$$

and \tilde{A}_k are *constant* matrices. The arguments of the logarithms α_i (*letters*) are functions of x .

Henn (2013): turn to a new basis where DE take the form

$$\partial_i f(\epsilon, x) = \epsilon A_i(x) f(\epsilon, x).$$

In the differential form,

$$d f(\epsilon, x) = \epsilon (d \tilde{A}(x)) f(x, \epsilon),$$

where

$$\tilde{A} = \sum_k \tilde{A}_k \log(\alpha_k).$$

and \tilde{A}_k are *constant* matrices. The arguments of the logarithms α_i (*letters*) are functions of x .

Let us call it *epsilon form* and the corresponding basis *canonical*.

The case of two scales, i.e. with one variable in the DE, i.e.
 $n = 1$.

The case of two scales, i.e. with one variable in the DE, i.e. $n = 1$.

One tries to achieve the following form of DE:

$$f'(\epsilon, x) = \epsilon \tilde{A}'(x) f(x, \epsilon) = \epsilon \sum_k \frac{a_k}{x - x^{(k)}} f(\epsilon, x).$$

where $x^{(k)}$ is the set of singular points of the DE and $N \times N$ matrices a_k are independent of x and ϵ .

The case of two scales, i.e. with one variable in the DE, i.e. $n = 1$.

One tries to achieve the following form of DE:

$$f'(\epsilon, x) = \epsilon \tilde{A}'(x) f(x, \epsilon) = \epsilon \sum_k \frac{a_k}{x - x^{(k)}} f(\epsilon, x).$$

where $x^{(k)}$ is the set of singular points of the DE and $N \times N$ matrices a_k are independent of x and ϵ .

For example, if $x_k = 0, -1, 1$ the matrix \tilde{A} involves $\log(x), \log(x \pm 1)$

and results for elements of such a basis are expressed in terms of harmonic polylogarithms (HPL) by E. Remiddi and J. Vermaseren.

Solve DE order in order in ε

$$f = \sum_i f^{(i)} \varepsilon^i$$

Solve DE order in order in ε

$$f = \sum_i f^{(i)} \varepsilon^i$$

$$\frac{d}{dx} f^{(i)} = A(x) f^{(i-1)}$$

Solve DE order in order in ε

$$f = \sum_i f^{(i)} \varepsilon^i$$

$$\frac{d}{dx} f^{(i)} = A(x) f^{(i-1)}$$

Solution

$$f^{(i)}(x) = \int_0^x A(x') f^{(i-1)}(x') dx' + c_i$$

$$\int_{0 \leq \tau_1 \leq \dots \leq \tau_k \leq X} d\tilde{A}(\tau_k) \dots \dots d\tilde{A}(\tau_1)$$

→ a linear combination of integrals

$$\int_{0 \leq \tau_1 \leq \dots \leq \tau_k \leq X} \frac{d\tau_k}{\tau_k + a_k} \dots \frac{d\tau_1}{\tau_1 + a_1}$$

where $a_i = 0, -1$ or 1 .

$$\int_{0 \leq \tau_1 \leq \dots \leq \tau_k \leq x} d\tilde{A}(\tau_k) \dots \dots d\tilde{A}(\tau_1)$$

→ a linear combination of integrals

$$\int_{0 \leq \tau_1 \leq \dots \leq \tau_k \leq x} \frac{d\tau_k}{\tau_k + a_k} \dots \frac{d\tau_1}{\tau_1 + a_1}$$

where $a_i = 0, -1$ or 1 .

HPLs

$$H(a_1, a_2, \dots, a_n; x) = \int_0^x f(a_1; t) H(a_2, \dots, a_n; t) dt,$$

where $f(\pm 1; t) = 1/(1 \mp t)$, $f(0; t) = 1/t$,

- We write down solutions of these differential equations in a straightforward way order-by-order in ϵ in terms of HPL with letters 0 and 1.

- We fix the boundary conditions for the canonical master integrals at the point $x = 1$ where integrals are analytic and reduce to well-known propagator integrals
[P.A. Baikov & K.G. Chetyrkin'10;
[R. N. Lee, A. Smirnov & V.S.'10]

- We fix the boundary conditions for the canonical master integrals at the point $x = 1$ where integrals are analytic and reduce to well-known propagator integrals
[P.A. Baikov & K.G. Chetyrkin'10;
[R. N. Lee, A. Smirnov & V.S.'10]
- We solve our differential equations asymptotically near the point $x = 0$ and fix these solutions by matching them to our solution at general x using HPL [D. Maitre'05].

- We fix the boundary conditions for the canonical master integrals at the point $x = 1$ where integrals are analytic and reduce to well-known propagator integrals
[P.A. Baikov & K.G. Chetyrkin'10;
[R. N. Lee, A. Smirnov & V.S.'10]
- We solve our differential equations asymptotically near the point $x = 0$ and fix these solutions by matching them to our solution at general x using HPL [D. Maitre'05]. The asymptotic solutions are linear combinations of powers $x^{k\epsilon}$ with $k = 0, 1, \dots, 8$. We pick up asymptotic terms with $k = 0$ and obtain the so-called naive values of the canonical master integrals at $x = 0$.

- We fix the boundary conditions for the canonical master integrals at the point $x = 1$ where integrals are analytic and reduce to well-known propagator integrals
[P.A. Baikov & K.G. Chetyrkin'10;

$$\frac{\partial}{\partial z_1} f^{(i)} = \bar{A}_1(z_1, z_2) f^{(i-1)},$$

$$\frac{\partial}{\partial z_2} f^{(i)} = \bar{A}_2(z_1, z_2) f^{(i-1)}.$$

[J. M. Henn, K. Melnikov & V. A. Smirnov'14]:

First, solve

$$\frac{\partial}{\partial z_1} f^{(i)} = \bar{A}_1(z_1, z_2) f^{(i-1)}$$

Solve DE order in order in ε

$$f = \sum_{i=0}^8 f^{(i)} \varepsilon^i$$

$$\frac{\partial}{\partial z_1} f^{(i)} = \bar{A}_1(z_1, z_2) f^{(i-1)},$$

$$\frac{\partial}{\partial z_2} f^{(i)} = \bar{A}_2(z_1, z_2) f^{(i-1)}.$$

[J. M. Henn, K. Melnikov & V. A. Smirnov'14]:

First, solve

$$\frac{\partial}{\partial z_1} f^{(i)} = \bar{A}_1(z_1, z_2) f^{(i-1)}$$

Solution

$$f^{(i)}(z_1, z_2) = \int_0^{z_1} d\bar{z}_1 \bar{A}_1(\bar{z}_1, z_2) f^{(i-1)}(\bar{z}_1, z_2) + h^{(i)}(z_2)$$

The result is a linear combination of multiple (Goncharov) polylogarithms (MPL) $G(a_1, a_2, \dots, a_w; z_1)$ where $a_i \in \{0, 1, z_2, 1 - z_2, 1/z_2, -z_2/(1 - z_2)\}$.

The result is a linear combination of multiple (Goncharov) polylogarithms (MPL) $G(a_1, a_2, \dots, a_w; z_1)$ where $a_i \in \{0, 1, z_2, 1 - z_2, 1/z_2, -z_2/(1 - z_2)\}$.

$$G(a_1, \dots, a_n; z) = \int_0^z \frac{dt}{t - a_1} G(a_2, \dots, a_n; t)$$

The result is a linear combination of multiple (Goncharov) polylogarithms (MPL) $G(a_1, a_2, \dots, a_w; z_1)$ where $a_i \in \{0, 1, z_2, 1 - z_2, 1/z_2, -z_2/(1 - z_2)\}$.

$$G(a_1, \dots, a_n; z) = \int_0^z \frac{dt}{t - a_1} G(a_2, \dots, a_n; t)$$

Substitute solution into the second equation to obtain

$$\begin{aligned} \frac{\partial}{\partial z_2} h^{(i)}(z_2) &= \bar{A}_2(z_1, z_2) h^{(i-1)}(z_2) \\ &+ \bar{A}_2(z_1, z_2) \int_0^{z_1} d\bar{z}_1 \bar{A}_1(\bar{z}_1, z_2) f^{(i-2)}(\bar{z}_1, z_2) \\ &- \frac{\partial}{\partial z_2} \int_0^{z_1} d\bar{z}_1 \bar{A}_1(\bar{z}_1, z_2) f^{(i-1)}(\bar{z}_1, z_2) \end{aligned}$$

The dependence on z_1 should drop out! (A useful check.)

The dependence on z_1 should drop out! (A useful check.)

A resulting equation for $h^{(i)}(z_2)$ can then be solved in terms of HPL with letters 0 and 1, up to constants.

The dependence on z_1 should drop out! (A useful check.)

A resulting equation for $h^{(i)}(z_2)$ can then be solved in terms of HPL with letters 0 and 1, up to constants.

To fix these 213×9 unknown constants, we match our results in terms of multiple polylogarithms to the leading order asymptotic behaviour of the solution of DE in the limit $z, \bar{z} \rightarrow 0$ which corresponds to the Euclidean limit $x_1 \rightarrow 0$.

The dependence on z_1 should drop out! (A useful check.)

A resulting equation for $h^{(i)}(z_2)$ can then be solved in terms of HPL with letters 0 and 1, up to constants.

To fix these 213×9 unknown constants, we match our results in terms of multiple polylogarithms to the leading order asymptotic behaviour of the solution of DE in the limit $z, \bar{z} \rightarrow 0$ which corresponds to the Euclidean limit $x_1 \rightarrow 0$.

If y is the expansion parameter in the limit $z_1, z_2 \rightarrow 0$ then we encounter the following power dependence

$$y^0, y^{-\varepsilon}, y^{-2\varepsilon}, y^{-3\varepsilon}, y^{-4\varepsilon}$$

An interplay between expansion by regions

and solving canonical DE in the given limit.

The short-distance limit is simple because the corresponding
integrals are four-loop propagator integrals
[P. Baikov & K. Chetyrkin'10; R. Lee & V.S.'11]

An interplay between expansion by regions
[M. Beneke & V.A. Smirnov'98]
and solving canonical DE in the given limit.

The short-distance limit is simple because the corresponding integrals are four-loop propagator integrals
[P. Baikov & K. Chetyrkin'10; R. Lee & V.S.'11]

One could consider also the short-distance limit $x_2 \rightarrow 0$ and the limits $z_1 \rightarrow 0, z_2 \rightarrow 1$ and $z_1 \rightarrow 1, z_2 \rightarrow 0$ which are light-cone limits $x_1^2 \rightarrow 0$ and $x_2^2 \rightarrow 0$.

An interplay between expansion by regions
[M. Beneke & V.A. Smirnov'98]
and solving canonical DE in the given limit.

The short-distance limit is simple because the corresponding integrals are four-loop propagator integrals
[P. Baikov & K. Chetyrkin'10; R. Lee & V.S.'11]

One could consider also the short-distance limit $x_2 \rightarrow 0$ and the limits $z_1 \rightarrow 0, z_2 \rightarrow 1$ and $z_1 \rightarrow 1, z_2 \rightarrow 0$ which are light-cone limits $x_1^2 \rightarrow 0$ and $x_2^2 \rightarrow 0$.

It turns out that the information about the the Euclidean limit $x_1 \rightarrow 0$ is sufficient.

The result for our integral is $(z - \bar{z})^{-2}$ times a linear combination of single valued multiple polylogarithms
[\[F. C. S. Brown'04\]](#)

$$\mathcal{L}_{\{a_1, \dots, a_8\}} = (-1)^{\sum a_i} G(a_1, \dots, a_8; z) + \sum c_{ij} G(\underline{a}_i; z) G(\underline{a}_j; \bar{z})$$

where $\underline{a}_i \cup \underline{a}_j$ has length 8 and \underline{a}_j is never the empty word.

The result for our integral is $(z - \bar{z})^{-2}$ times a linear combination of single valued multiple polylogarithms
[\[F. C. S. Brown'04\]](#)

$$\mathcal{L}_{\{a_1, \dots, a_8\}} = (-1)^{\sum a_i} G(a_1, \dots, a_8; z) + \sum c_{ij} G(\underline{a}_i; z) G(\underline{a}_j; \bar{z})$$

where $\underline{a}_i \cup \underline{a}_j$ has length 8 and \underline{a}_j is never the empty word.

The coefficients c_{ij} are polynomials of multiple zeta values such that all branch cuts cancel. The entries in the weight vectors are in the set $\{0, 1\}$ and the "condensed notation" $\dots 0, 0, 0, 1 \dots = \dots 4 \dots$ etc. is used

After flipping points $x_2 \leftrightarrow x_3$ (i.e. $z \rightarrow 1/z$, $\bar{z} \rightarrow 1/\bar{z}$)
followed by $x_1 \leftrightarrow x_2$ (which implies $z \rightarrow 1 - z$, $\bar{z} \rightarrow 1 - \bar{z}$):
this function takes the form

$$\begin{aligned} & - \mathcal{L}_{\{3,5\}} + \mathcal{L}_{\{5,3\}} + \mathcal{L}_{\{2,5,0\}} - \mathcal{L}_{\{4,3,0\}} - \mathcal{L}_{\{1,5,0,0\}} + \mathcal{L}_{\{3,3,0,0\}} \\ & - \mathcal{L}_{\{2,3,0,0,0\}} + \mathcal{L}_{\{1,3,0,0,0,0\}} \end{aligned}$$
